

SPORT DRAIN MAX AND ALTERNATE INFILLS

At ESS, we continue to pursue the best solution for synthetic turf athletic fields. Continued concern over traditional infill materials has created the need for alternates. ESS helps owners, engineers, and turf professionals to develop these innovative technologies and implement them in cost effective *Best Practice* designs.

By using Sport Drain_{MAX} *Drainage and Impact Attenuation Layer* under the synthetic turf, alternate infill materials can be easily and inexpensively adopted to create a high performing, safe athletic surface. We have extensive experience and data with almost every type of synthetic turf infill on a base layer of Sport Drain_{MAX}. Please see just a few of our selected projects below. Contact us directly for more information regarding these projects.
